

All 6 arms of the antenna are grouped and labelled A to F. Each arm consists of three parts : A, A1, A2 next B, B1, B2...etc.

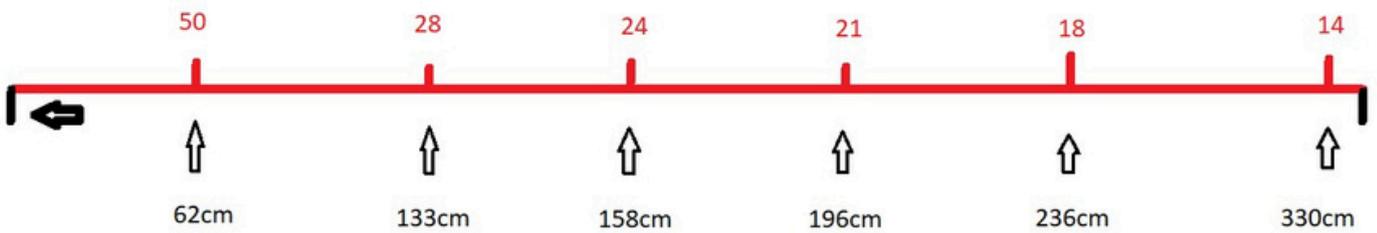

We assemble them in sequence until we get each antenna arm in its entirety.

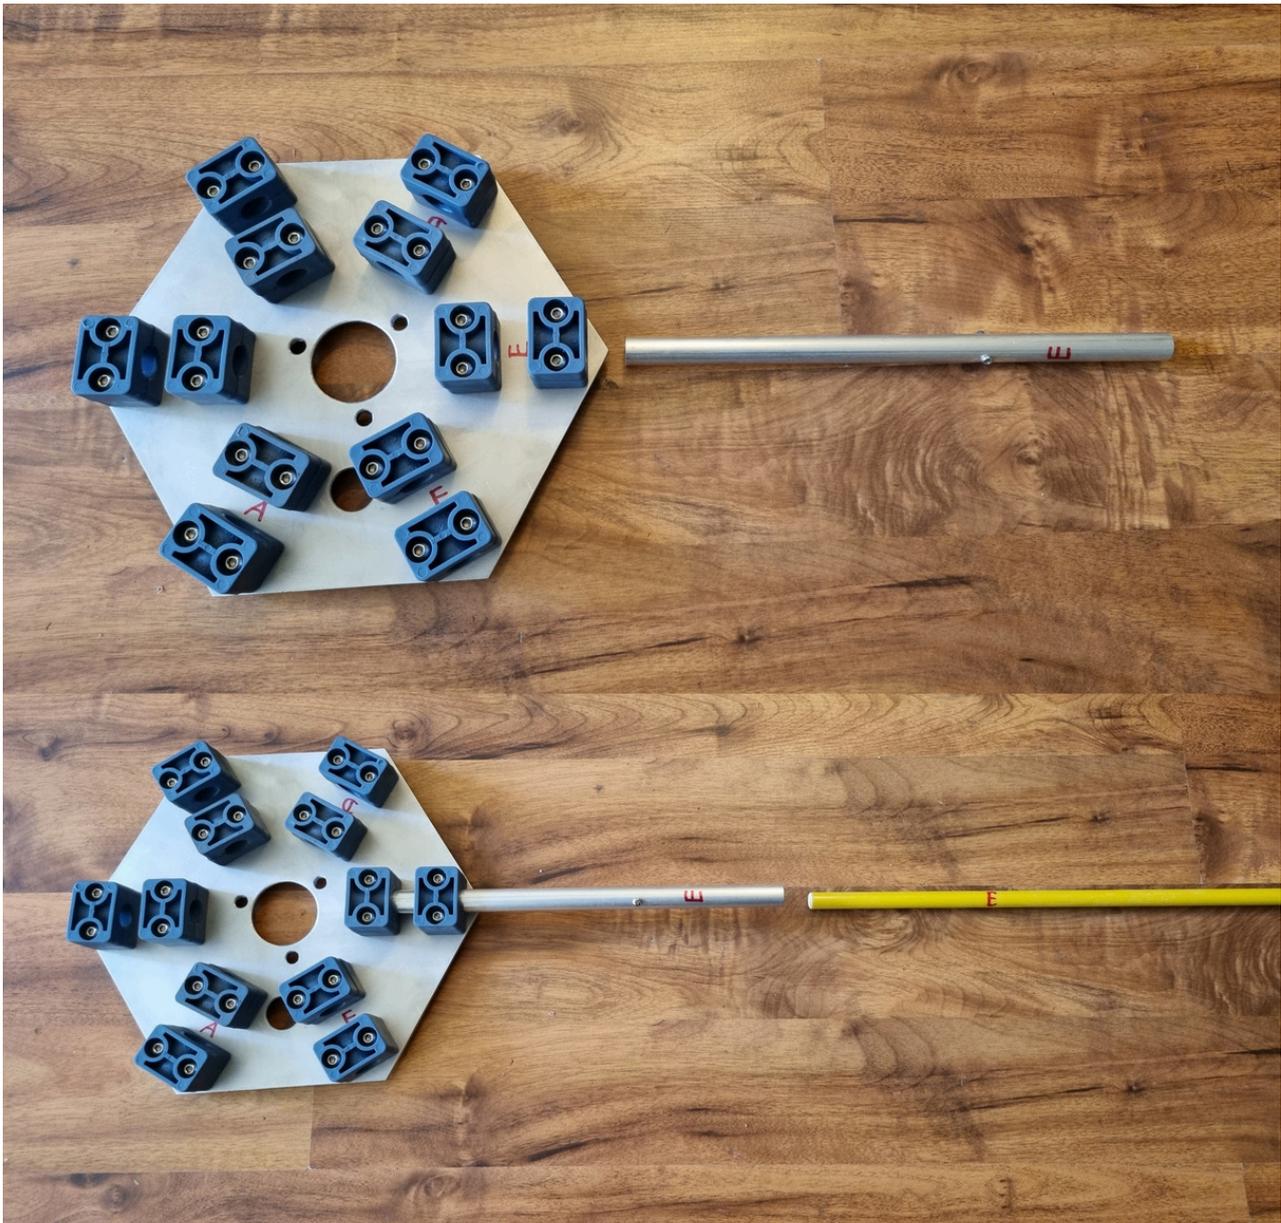

Cable clamp mounting points for each band. Dimensions are given from the beginning of the yellow spreader.

All distances will probably need to be adjusted once the antenna is assembled into a whole. Of course, everything with sensitivity.

The kit includes 6 aluminium tubes to be mounted to the central plate.

Note that the tubes are drilled on one side, once the centre plate is mounted on the centre post, the antenna arm should be inserted into the tube.

Note that the front of the antenna is in the direction in which the socket (so239) and cable hole on the antenna motherboard are located.

The installation of the green lines and their layout is shown. All lines are the same length.
